

Safety, security, videosurveillance, CCTV, business intelligence,
traffic management, video analysis, image processing

ACIC

*ACIC is a Belgian company created in October 2003 in Mons.
ACIC is a spin-off from MULTITEL research center, Faculty of engineering of Mons and
Université catholique de Louvain.*

The company is supported by the Walloon Region.

ACIC is a provider for video analysis solutions for

- Video Surveillance
- Road traffic monitoring
- People counting

In order to provide systems that meet EXACTLY YOUR NEEDS, our products are TAILOR MADE. ACIC has developed a range of basic software modules and standard application hardware that can be easily combined into a complete solution. The BASIC SOFTWARE MODULES are small independent information control tools. They can be easily combined into a full software product that satisfies our customer's needs.

The STANDARD APPLICATION HARDWARE are complete system configurations. They are used to build in specific application hardware using ONLY necessary components. This has a direct impact on the product price as the customer only buys the needed basic equipments. While decreasing the price, this has no impact on future compatibility, as system modifications and upgrades remains possible.

For each project, ACIC defines the system requirements in accordance with the customer's needs, to offer a streamlined system configuration at the best quality/price ratio possible. CMVision and RMVision are industrial class hardware platforms dedicated to real-time video analysis. These two devices support all video analysis applications produced by ACIC.
